### Grenzen der klassischen Physik

Markus Lippitz 10. September 2024

By the end of this chapter, you should be able to draw, calculate and align a ray's path through an optical system.

#### **Overview**

I assume that you have seen a little bit of geometrical optics in your studies, but we will briefly review it. We will introduce the postulates of ray optics and discuss rays at a mirror and a lens as an example. I will also introduce the matrix method of ray optics, which is a very convenient way of calculating the path of a ray through a system of optical elements. More details on these topics can be found in chapter 1 of Saleh und Teich, 1991, chapter 2 of Hering\_Martin\_Optik, chapters 5 and 6 of Hecht\_Optics, chapter 2 of Konijnenberg\_Optics.

#### Postulates of ray optics
